Glossary

algae – a group of small aquatic plants; occur as one-celled, filaments or colonial; having no true root, stem or leaf; the base of the aquatic food chain.

algae bloom – a heavy growth of algae in a body of water; blooms commonly caused by high concentrations of nutrients in the water column.

anoxic – a condition of no oxygen in a water body or in soil.

anthropogenic – resulting from human activities.

aquifer – a water-storing underground geologic formation.

atmospheric deposition – the transfer of pollutants and nutrients suspended in the air to the ground or open water; deposition commonly metals and compounds of nitrogen and sulfur.

beach renourishment – the process of pumping sand onto eroded beaches; material for this process commonly taken from channels and offshore resources.

beneficiation – an industrial process to transform phosphate pebble (rock) into commercially marketable phosphate; the process is an energy-intensive activity.

benthic – referring to the bottom of a body of water.

best management practices (BMP) – a practice or combination of practices that provide the most effective and practicable means of controlling point and nonpoint pollutants at levels compatible with environmental quality goals.

biochemical oxygen demand (BOD) – the quantity of oxygen demand present in a sample as measured by a specific test; a major objective of conventional wastewater treatment is to reduce the BOD so that the oxygen content of the water body will not be significantly reduced; although BOD is not a specific compound, it is defined as a conventional pollutant under the federal Clean Water Act.

biodiversity – a network of composition, structure and function of a given system that encompasses the natural biological wealth of organisms.

brackish – water with salinity common to estuaries; this condition has a salinity concentration between fresh and marine.

carnivore – flesh-eating organism.

coliform bacteria – a type of bacterium that in high concentrations indicates a polluted water body; this type occurs in animal feces.

deep-well injection – a process whereby a liquid, usually treated water or wastewater, is pumped underground.

detritus – small particles of rock, sand and/or dead organic and disintegrating vegetation.

development – residential, commercial, industrial and agricultural land uses.

dredge spoil – sand and/or mud removed from the bottom of a water body after dredging.

ecosystem – a system formed by the interaction of a community of organisms with their environment.

effluent – water released into the environment; commonly from wastewater treatment processes or industrial processing.

epiphytes – a plant growing on, but not parasitic on, another organism; epiphytes are a general classification of algae commonly attached to seagrasses.

estuary – a tidally influenced ecological system where rivers meet the sea and fresh water mixes with salt water.

eutrophic – a water quality condition typified by high productivity and nutrient inputs, with periods of oxygen deficiency from algae decomposition; this condition can be accelerated by pollution.

exotic species – a plant or animal species not native to an ecosystem.

fauna – animals of a region.

flora – plants of a region.

ground water – water stored in underground geologic formations; replenished from surface infiltration.

habitat – the specific place or environment where a particular plant or animal lives; an organism habitat must provide all the basic requirements for life and should be free of harmful contaminants.

hypoxia – a condition of low dissolved oxygen in the water; hypoxia typically indicates less than or equal to two milligrams of oxygen per liter.

inlet – a short, narrow waterway connecting a bay or lagoon with the sea.

intertidal – the area of bay bottom and adjacent wetlands that is alternately covered with water and then exposed due to the rise and fall of tide waters.

littoral drift – the parallel movement of suspended sand along the beach that is caused by longshore currents.

mangrove – a salt-tolerant, subtropical tree found in estuarine and marine environments; mangrove leaves are an integral part of the food web.

nonpoint-source pollution – pollution from no specific source; this type of pollution is generally from surface water, ground water or rainwater coming in contact with contaminants on the land or air such as pesticides, herbicides, fertilizers, animal waste, gasoline, vehicle exhaust, power plant emissions and liquid waste from failing household septic systems; this source of pollution is difficult to measure.

nutrients – any substance required by organisms for normal growth and maintenance; mineral nutrients usually refer to inorganic substances derived from soil and water; excessive amounts of nutrients, including nitrogen and phosphorus, may result in excessive growth of algae, leading to oxygen depletion and water quality degradation.

photosynthesis – the synthesis of organic matter from inorganic substrates using light as a source of energy.

plankton – passively floating or weakly motile microscopic plant and animal life; refers to various species of plants and animals at or near the base of the aquatic food chain.

plat – a map, drawn to scale, showing the divisions of a piece of land. The act of platting divides land areas under a single ownership in order to sell it to different owners.

point-source pollution – pollution from a specific source such as a stormwater pipe, wastewater plant discharge or industrial discharge; easier to quantify this source.

red tide – characterized by an above-average concentration of the toxic phytoplankton *Karenia brevis*; red tide causes fish and manatee mortality and shellfish contamination; process thought to be linked to high freshwater flows and nutrients in marine waters.

rookery – the breeding or nursery ground of birds or mammals.

runoff – the portion of precipitation on the land that reaches a water body.

salinity – a measure of the dissolved salts in a water body, especially of sodium, magnesium and potassium.

salt flat – a tidal area where seawater evaporates and salt concentrates.

salt marsh – coastal ecosystems with communities of salt-tolerant plants occupying intertidal zones that are at least occasionally inundated with salt water; refers to a type of marsh that exists at interface of land and marine waters.

saltwater intrusion – a process of high salinity ground water moving inland and mixing with low salinity ground water; intrusion commonly results from overpumping groundwater resources.

SAV – abbreviation for “submerged aquatic vegetation,” including seagrasses and other submerged aquatic vegetation.

seagrass – extremely productive flowering vascular marine plants found in estuaries and shallow open shelves off the coast; seagrass provides habitat for numerous fishes and invertebrates; turtle grass, manatee grass and shoal grass are three common species existing in Florida.

seawall – a wall or embankment constructed along a shore to reduce erosion from wave action; the structure greatly reduces tidal habitat.

septic system – a system of tanks and porous pipes in which wastewater is treated by aerobic and anaerobic bacterial decomposition in the surrounding soil; septic systems are a common source of pollution to surface and ground water if not functioning properly.

stormwater runoff – water from rain, often carrying oils, nutrients, sediments, trash, dissolved metals and other pollutants; storm water is a major source of pollution to rivers, lakes and estuarine waters.

tide – periodic rising and falling of the oceans resulting from lunar and solar forces acting upon the rotating earth; tide action strongly influences marine and estuarine plants, animals and bottom configuration.

tributary – a body of water that empties into a larger body of water.

trophic state – the nutritional status of a particular body of water; nitrogen and phosphorus, the principal waterborne nutrients, commonly influence the trophic state.

turbidity – a measurement of water clarity; caused by a suspension of fine solids and microscopic organisms, particularly algae.

uplands – terrestrial areas above the influence of tide waters.

urban – residential, commercial and industrial land uses that can be characterized as classically urban and suburban densities.

urbanization – the conversion of low-density open spaces to high-density human development such as houses or shopping malls; process decreases the volume of groundwater infiltration and increases stormwater runoff.

watershed – a drainage area or basin in which all surface waters resulting from precipitation or ground water drains toward a central collector such as a stream, river or lake at a lower elevation.

wetland – an ecosystem defined by specific plant, soil and hydrologic characteristics; plants in wetlands are adapted to tolerate wet conditions.

zooplankton – microscopic animals that float freely in water, graze on detritus particles, bacteria and algae, and may be consumed by fish.
